## AP CALCULUS PROBLEM SET \#13 DIFFERENTIAL EQUATIONS

## (74-7)

1. The rate of change in the number of bacteria in a culture is proportional to the number present. In a certain laboratory experiment, a culture has 10000 bacteria initially, 20000 at time $t_{1}$, and 100000 at time $\left(t_{1}+10\right)$ minutes
(a) In terms of $t$ only, find the number of bacteria in the culture at any time $t$ minutes, $t \geq 0$
(b) How many bacteria were there after 20 minutes?
(c) How many minutes had elapsed when the 20000 bacteria were observed?
2. Consider the differential equation $\frac{d y}{d x}=e^{y}\left(3 x^{2}-6 x\right)$. Let $y=f(x)$ be the particular solution to the differential equation that passes through $(1,0)$.
(a) Write an equation for the line tangent to the graph of $f$ at the point $(1,0)$. Use the tangent line to approximate $f(1.2)$.
(b) Find $y=f(x)$, the particular solution to the differential equation that passes through $(1,0)$.

## (93-6)

3. Let $P(t)$ represent the number of wolves in a population at time $t$ years, when $t \geq 0$. The population $P(t)$ is increasing at a rate directly proportional to $800-P(t)$, where the constant of proportionality is $k$.
(a) If $P(0)=500$, find $P(t)$ in terms of $t$ and $k$.
(b) If $P(2)=700$, find $k$.
(c) Find $\lim _{t \rightarrow \infty} P(t)$.

## (97-6)

4. Let $v(t)$ be the velocity, in feet per second, of a skydiver at time $t$ seconds, $t>0$. After her parachute opens, her velocity satisfies the differential equation $\frac{d v}{d t}=-2 v-32$, with initial condition $v(0)=-50$.
(a) Use separation of variables to find an expression for $v$ in terms of $t$, where $t$ is measured in seconds.
(b) Terminal velocity is defined as $\lim _{t \rightarrow \infty} v(t)$. Find the terminal velocity of the skydiver to the nearest foot per second.
(c) It is safe to land when her speed is 20 feet per second. At what time $t$ does she reach this speed?
$\begin{aligned} & \text { 5. Consider the differential equation } \\ & 500-6) \\ & d x\end{aligned}=\frac{d y}{e^{2 y}}$
(a) Find a solution $\mathrm{y}=f(x)$ to the differential equation satisfying $f(0)=\frac{1}{2}$.
(b) Find the domain and range of the function $f$ found in part (a).
(2011-5)
5. At the beginning of 2010, a landfill contained 1400 tons of solid waste. The increasing function $W$ models the total amount of solid waste stored at the landfill. Planners estimate that $W$ will satisfy the differential equation $\frac{d W}{d t}=\frac{1}{25}(W-300)$ for the next 20 years. $W$ is measured in tons, and $t$ is measured in years from the start of 2010.
(a) Use the line tangent to the graph of $W$ at $t=0$ to approximate the amount of solid waste that the landfill contains at the end of the first 3 months of 2010 (time $t=\frac{1}{4}$ ).
(b) Find $\frac{d^{2} W}{d t^{2}}$ in terms of $W$. Use $\frac{d^{2} W}{d t^{2}}$ to determine whether your answer in part (a) is an under- estimate or an overestimate of the amount of solid waste that the landfill contains at time $t=\frac{1}{4}$.
(c) Find the particular solution $W=W(t)$ to the differential equation $\frac{d W}{d t}=\frac{1}{25}(W-300)$ with initial condition $W(0)=1400$.

## OPTIONAL

(89-6)
7. Oil is being pumped continuously from a certain oil well at a rate proportional to the amount of oil left in the well; that is, $\frac{d y}{d t}=k y$, where $y$ is the amount of oil left in the well at any time $t$. Initially there were 1000000 gallons of oil in the well, and 6 years later there were 500000 gallons remaining. It will no longer be profitable to pump oil when there are fewer than 50000 gallons remaining.
(a) Write an equation for $y$, the amount of oil remaining in the well at any time $t$.
(b) At what rate is the amount of oil in the well decreasing when there are 600,000 gallons of oil remaining ?
(c) In order not to lose money, at what time $t$ should oil no longer be pumped from the well?
(2010-6)
8. Solutions to the differential equation $\frac{d y}{d x}=x y^{3}$ also satisfy $\frac{d^{2} y}{d x^{2}}=y^{3}\left(1+3 x^{2} y^{2}\right)$.

Let $y=f(x)$ be a particular solution to the differential equation with $f(1)=2$.
(a) Write an equation for the line tangent to the graph of $y=f(x)$ at $x=1$.
(b) Use the tangent line equation from part (a) to approximate $f(1.1)$. Given that $f(x)>0$ for $1<x<1.1$, is the approximation for $f(1.1)$ greater than or less than $f(1.1)$ ? Explain your reasoning.
(c) Find the particular solution $y=f(x)$ with initial condition $f(1)=2$.
(83-5)
9. At time $t=0$, a jogger is running at a velocity of 300 meters per minute. The jogger is slowing down with a negative acceleration that is directly proportional to time $t$. This brings the jogger to a stop in 10 minutes.
(a) Write an expression for the velocity of the jogger at time $t$.
(b) What is the total distance travelled by the jogger in that 10 -minute interval?
10. At time $t, t \geq 0$, the volume of a sphere is increasing at a rate proportional to the reciprocal of its radius. At $t=0$, the radius of the sphere is 1 and at $t=15$, the radius is 2 .
(The volume V of a sphere with radius r is $V=\frac{4}{3} \pi r^{3}$ )
(a) Find the radius of the sphere as a function of $t$.
(b) At what time $t$ will the volume of the sphere be 27 times its volume at $t=0$ ?
